Compound Registration

Compound Registration compares the uniqueness of new small molecules against those already stored in your database, kickstarting a decision workflow based on your configured business logic.

The challenge is creating and maintaining a unique collection of small molecules and their additional data. Business logic driven automated compound submission processing with consistent and accurate data representation. Efficient tracking and management of compounds.

Register new compound batches (real, virtual, no-structures, mixtures, polymers, etc.) with best-in-class uniqueness checking

Ensure consistent, accurate registrations with built-in Standardizer and Structure Checker

Integrate Compound Registration with your ELN and data systems

Registration

- Register compounds individually or in bulk (real, virtual, no-structures, multi-components, etc.)
- Validate and check unique structures (Standardizer and Structure Checker)
- Store compounds in a hierarchical structure

Modify

- Amend registered entities

Integrations: RESTful API

220 employees

26 years in the field

3 offices in the Americas and Europe

1 M active users serving 9 out of 10 leading pharmaceutical companies
